Energy Information Administration Weekly Coal Production

Weekly Coal Production provides timely information on coal: current statistics on the production of anthracite, bituminous coal, and lignite are provided each week; monthly, quarterly, and annual statistics on coal consumption, production, stocks, imports, and exports, and related supply and demand data are provided as they become available.

Weekly Coal Production is intended for use by the coal industry, the press, State and Federal Governments, policy makers, consumers, and analysts. Weekly coal production estimates are based on current trends in weekly rail carloadings of coal and current coal production trends as reported in *Coal Distribution* (Form EIA-6), monthly and quarterly coal production reports from State mine agencies, and *Coal Production Annual* (Form EIA-7a).

This report was prepared by the Energy Information Administration, the independent statistical and analytical agency within the Department of Energy. The information contained herein should not be construed as advocating or necessarily reflecting any policy position of the Department of Energy or any other organization.

This publication is available on an annual subscription basis from the Superintendent of Documents, U.S. Government Printing Office.

Weekly Coal Production

Energy Information Administration
Washington, D.C.

Production for Week Ended:
December 31, 1983

Published:
January 9, 1984

Highlights

PRELIMINARY U.S. COAL PRODUCTION
ESTIMATED AT 784.9 MILLION SHORT TONS IN 1983

Coal Production in the United States in 1983, as estimated by the Energy Information Administration, was 784.9 million short tons, down 6.4 percent from the record-high 838.1 million short tons produced in 1982. Coal production in the fourth quarter of 1983, however, unlike output in the three previous quarters, rose substantially over year earlier levels. Production in the final three months of 1983 totaled 209.7 million short tons, an increase of 5.9 percent from output of 198.0 million short tons in the fourth quarter of 1982.

U.S. coal production in 1983 consisted of an estimated 780.9 million short tons of bituminous coal and lignite and 4.0 million short tons of Pennsylvania anthracite.

The largest decline in production in 1983 occurred in the Appalachian Region, where output was an estimated 58.8 million short tons below that of 1982. Coal production in States in the Interior Region declined 0.6 million short tons, while production in Western States rose an estimated 6.1 million short tons in 1983.

With an estimated output of 133.7 million short tons, Kentucky continued as the Nation's largest coal producer. Wyoming, with output of 116.8 million short tons, became the second largest producer by outproducing West Virginia. Ranking third among coal producing States, West Virginia produced 111.1 million short tons in 1983, 17.5 million short tons below output in 1982.
